PROJECT AWAKENING

MASTER PRODUCT REQUIREMENTS DOCUMENT | V2.0 | 27 OCT 2026

Physical-body transformation RPG • Android-first beta • Original anime-inspired visual identity

Executive decision

Build a game that converts safe, personalized physical training into quests, verifiable progress and visible character rewards. This revision removes ALL skincare, hair, fashion, clothing-styling and grooming features. It supersedes the prior PRD.

1. Product scope and constraints

In scope	Out of scope
Strength, endurance, mobility, activity habits	Skin, hair, grooming, fashion and styling
6-question first-run onboarding; 16-field profile	50-question intake, forced photos, attractiveness ratings
Daily quests, XP, ranks, avatar cosmetics	Guaranteed transformations or medical diagnosis
Optional camera verification; paid AI coach later	Mandatory camera or video upload
Accessibility choice and notification preference	Forced operating-system notification permission

2. Audience and positioning

Initial release: adults 18+, all genders, including beginners and experienced exercisers. The app is a progression game, not a clinical treatment or guaranteed body-change program. A user can start at E Rank regardless of fitness ability; exercise prescription must reflect ability and limitations, not rank.

3. First-run journey and exact questions

Install → welcome and consent → 6 quick questions → basic player profile (37.5%) → generic avatar + E Rank / Level 1 → safety/accessibility/notification gate before first workout → first tailored quest → profile completion prompt.

Six mandatory initial fields, one question per screen. The goal prompt must say exactly “What’s Your Goal?”

#	Question	Answer / behavior
01	How old are you?	Age in years; adult eligibility gate
02	What’s your gender?	Male / Female / Non-binary / Prefer not to say; for avatar presentation only, not fitness capability

03	What's your height?	cm or ft/in; numeric validation
04	What's your weight?	kg or lb; numeric validation
05	What's Your Goal?	Build Muscle / Lose Fat / Get Stronger / Improve Stamina / Build an Athletic Body / General Fitness
06	What's your experience level?	Beginner / Intermediate / Advanced

At completion: 6 of 16 profile fields = 37.5%. All players receive E Rank and Level 1; a neutral, generic anime avatar is created from a user-selected presentation, never inferred as an exact body replica. Height and weight are required in this agreed product design; provide clear privacy explanations and allow later correction.

4. Remaining 10 profile questions

#	Question	Answer / behavior
07	Where will you train?	Home / Gym / Both
08	What equipment can you use?	None / Basic / Full gym; conditional list
09	How many days per week can you train?	1–7
10	How much time per session?	10 / 15 / 20 / 30 / 45 / 60+ minutes
11	Do you have injuries, pain or movement restrictions?	No / Yes / Unsure; details optional, safety triage
12	How active are you currently?	Mostly seated / Light / Moderate / Very active
13	What is your waist measurement?	cm/in; guided measuring instructions
14	What is your chest measurement?	cm/in; guided measuring instructions
15	Do you need accessibility accommodations?	None / Mobility / Vision / Hearing / Other / Prefer not to say
16	What reminder schedule do you prefer?	Time / No reminders; OS permission requested only if opted in

Questions 11, 15 and 16 are mandatory selections before any exercise quest, even if the user does not complete the remaining profile fields. This preserves the six-question fast onboarding while enforcing a safety and preferences gate. The user can select "No", "None", or "No reminders"; notification permission itself is never compulsory. If injury status is Yes/Unsure, pause high-risk exercise assignment and offer safer, non-diagnostic guidance or referral as appropriate.

5. Profile completion, rank and fitness progress

Profile completeness = 100 × completed valid fields / 16. Initial score = 37.5%; 8/16 = 50%; 12/16 = 75%; 16/16 = 100%. Do not award XP for entering measurements. Safety-gate questions count as complete only when a valid response is recorded; "Prefer not to say" counts when explicitly supported. Profile completion is NOT a health, attractiveness or fitness score.

Separate metric	How it changes
Profile completeness	Valid answers to the 16 fields
Player level / rank	XP from eligible quests and achievements
Physical progress	Repeated comparable performance, activity and measurement check-ins
Verification confidence	Self-report, device signals or validated pose-based check; never absolute proof

6. Quest engine functional requirements

- Rules-first engine selects exercise from reviewed movement library using goal, experience, equipment, time, current activity, limitations, recent workload and recovery.
- No full exercise prescription until safety gate is complete. Missing equipment/time fields trigger safe starter quests or a prompt for minimum information, never fabricated personalization.
- Every quest has: movement ID, instructions, demo, intensity, sets/reps or duration, rest, adaptation, stop conditions, verification mode, XP cap and completion event.
- Include strength, endurance, mobility and recovery days. Scale training gradually based on actual performance and perceived exertion; do not increase intensity automatically when game level rises.
- Exercise catalog must contain muscle groups, pattern, equipment, difficulty, progressions/regressions, common errors, exclusion flags and evidence review date.
- First beta: limited professionally reviewed beginner and intermediate movements, not an unvalidated 200-exercise dump.

7. Quest example and progression

Player	Example quest	Adaptation
Beginner, home, 15 min	Supported squat 2×8; wall push-up 2×8; short walk	Lower volume or replace if painful
Experienced, gym, 45 min	Squat pattern; press; row; hinge; cooldown	Sets/load based on recent performance
Recovery day	Comfortable walk + gentle mobility	Rest or low-impact alternatives

These are product examples, not individualized medical prescriptions. Weekly quest variety, rest and training balance take priority over dramatic daily difficulty spikes.

8. Verification strategy

MVP: self-report for low-stakes quests; optional camera-based rep detection for 3–5 supported exercises (e.g., squat, wall/standard push-up, jumping jack) after calibration. Prefer on-device pose estimation. Do not require uploads or store raw video by default. Tracking is fallible: angle, occlusion, lighting and atypical movement create false positives/negatives.

Mode	Use	Reward policy
Self-report	Walks, recovery, untracked exercise	Base XP; anti-spam caps
Pose-assisted	Supported exercises	Additional verified badge/XP

		within caps
Wearable/device	Steps or activity where permission exists	Evidence marker; spoofing protections
Competitive	Matched challenges	Eligibility and audit rules; never claim perfect proof

Provide manual correction/appeal, accessible alternatives to camera verification, explicit camera consent and a delete-data control. Never tie essential progression solely to camera availability.

9. RPG economy and long-term progression

All players start E Rank / Level 1. Proposed ranks: E, D, C, B, A, S, SS, Mythic. XP thresholds, daily caps and anti-farming rules are configurable and must be tuned in beta. High rank reflects sustained participation, not physical worth. Beyond Mythic: prestige, class mastery, seasons and cosmetic collections; preserve real training history on prestige.

Rewards: avatar skins, auras, titles, borders, animations, non-transferable in-game currency and achievement cards. Do NOT give away costly AI coaching by default. Avoid pay-to-win ranking and dangerous workout incentives.

10. Player profile, avatar and progress

- Profile shows completion percent, missing questions, player level, rank, quest streak, earned cosmetics, and fitness milestones.
- Avatar is generic on day one; visual evolution is cosmetic and earned, not a scientifically accurate body simulation.
- Track weight and waist/chest at optional recurring check-ins; show measurement trends separately from strength/endurance changes.
- Photos optional and private; never required to level up. Provide standardized photo guidance only if enabled.

11. Paid AI coach

Phase 2+ paid subscription: personalized explanations, workout adaptation proposals, progress summaries and question answering. Coach must use approved exercise catalog and safety constraints; no medical diagnosis, crash diets or guaranteed results. Free tier retains basic quests and safe progression. Meter usage and enforce per-user inference budgets.

12. Boss battles and multiplayer

Not MVP. Later: solo weekly bosses, matched PvP consistency battles, guild missions and seasonal events. Match by capability, available time and goal as well as rank; score adherence to personalized goals rather than maximum reps or weight lifted. Include anti-cheat, moderation, opt-out and accessibility parity.

13. UX and visual direction

Original dark-fantasy anime-inspired interface with system alerts, status panels, quest cards, subtle motion and celebratory level-ups. Do not copy Solo Leveling art, characters, trademarks or distinctive UI assets. Support reduced motion, screen readers, large text, contrast, and audio-off play.

14. Data model and APIs

Entity	Minimum fields
User	id, auth, age eligibility, consent versions, locale, timezone
Profile	16 answers, units, timestamps, completion score, accessibility
Avatar	base template, selected presentation, cosmetics
Exercise	id, movement pattern, contraindication flags, adaptations, review status
Quest	id, user, date, exercise ids, target, state, safety version
QuestEvent	completion mode, timestamps, device signal, XP decision
ProgressLog	date, metric, value, unit, source
Wallet	XP, level, rank, currency ledger, unlocked cosmetics
Subscription	plan, entitlement, renewal, AI usage limits

Core endpoints: POST /onboarding, PATCH /profile, GET /profile/completion, GET /quests/today, POST /quests/{id}/start, POST /quests/{id}/complete, GET /progress, GET /rewards, POST /consents. Server owns XP, verification decisions, rank and entitlements; clients cannot directly set these values.

15. Security, privacy and safety

- Treat measurements, health limitations and progress photos as sensitive personal data; minimize collection, encrypt, restrict access and enable export/deletion.
- Obtain clear consent for camera and health-related data processing; separate marketing consent. Provide retention/deletion policy and comply with applicable laws in launch markets.
- Require adult eligibility in initial beta; design a separate child-safety approach before expanding to minors.
- Support no-notification choice; never block app use if push permission is denied.
- Exercise screening is not a diagnosis. Show stop-exercise guidance for pain, dizziness or other concerning symptoms and recommend professional assessment where needed.

16. Analytics and acceptance criteria

Area	Release acceptance
Onboarding	6 questions create a profile and display 37.5% accurately
Profile	10 additional questions produce 100%; updates recompute immediately
Safety	No workout begins before limitations, accessibility and reminders selections

Quest personalization	Distinct profiles yield appropriate different plans; unsafe options filtered
Progression	Only server-validated events grant XP; idempotent completion
Accessibility	Reduced-motion, screen-reader and camera-free completion paths
Privacy	User can review/edit/delete measurements and revoke optional permissions

Track onboarding completion, first-quest activation, D1/D7/D30 retention, quest adherence, weekly active players, camera verification errors, injury-related reports, conversion, AI cost per subscriber and churn. Proposed go/no-go targets must be set after a pilot baseline, not presented as proven benchmarks.

17. Phased build and launch gates

Phase	Deliverable	Gate
0 • Specification	Final 16 fields, safety logic, quest data schema	No ambiguous mandatory fields
1 • Core MVP	Onboarding, profile, E-rank, avatar, basic quests, XP	End-to-end functional and safe
2 • Progression	Adaptive scheduling, progress logs, cosmetics	Beta users complete repeat sessions
3 • Verification	On-device motion detection for limited exercises	Measured error rates and fallback
4 • Monetization	Paid AI coach, entitlement and usage controls	Positive contribution margin hypothesis tested
5 • Social	Boss battles, guilds, seasons	Moderation and fairness validated

18. Open decisions before implementation

- Confirm adult-only launch markets and applicable privacy rules.
- Decide if “gender” is used only for avatar presentation and whether avatar selection should be independent.
- Define safe starter quest behavior when profile is 37.5% but training time/equipment are unknown.
- Have a qualified exercise professional review catalog, limitations and progression rules.
- Validate that requiring height/weight does not create excessive onboarding abandonment.
- Define exact XP economy and subscription price using beta evidence.

DOCUMENT STATUS: Revised product specification for planning and implementation scoping. No claims of clinical validation, guaranteed outcomes or proven unit economics.
